Problem 1: Multiplication Table

Source Code:

```
1 usage
2 def multiplication_table(rows, cols):
3     for x in range(1, rows + 1):
4         for y in range(1, cols + 1):
5             print(x*y, end="\t")
6         print()
7
8 rows = int(input("Enter of how many Rows:"))
9 cols = int(input("Enter of how many Columns:"))
10 multiplication_table(rows, cols)
```

Output

```
Enter of how many Rows:5
Enter of how many Columns:5
1  2  3  4  5
2  4  6  8 10
3  6  9 12 15
4  8 12 16 20
5 10 15 20 25

Process finished with exit code 0
|
```

```
Enter of how many Rows:10
Enter of how many Columns:10
1  2  3  4  5  6  7  8  9 10
2  4  6  8 10 12 14 16 18 20
3  6  9 12 15 18 21 24 27 30
4  8 12 16 20 24 28 32 36 40
5 10 15 20 25 30 35 40 45 50
6 12 18 24 30 36 42 48 54 60
7 14 21 28 35 42 49 56 63 70
8 16 24 32 40 48 56 64 72 80
9 18 27 36 45 54 63 72 81 90
10 20 30 40 50 60 70 80 90 100
```

Problem 2: Create a Bank

Source Code:

```
1 usage
2 def show_balance(balance):
3     print("#####")
4     print(f"Your Balance is ${balance:.2f}")
5     print("#####")
6
7 1 usage
8 def deposit(balance):
9     amount = float(input("Enter Amount of cash to be deposit:"))
10    balance += amount
11    return balance
12
13 1 usage
14 def withdraw(balance):
15     amount = float(input("Enter amount of cash to be withdraw:"))
16     if amount > balance:
17         print("Insufficient funds")
18     else:
19         balance -= amount
20     return balance
21
22 1 usage
23 def main():
24     balance = 0.0
25     while True:
26         print("ABCCDE ATM")
27         print("#####")
28         print("1.Show Balance")
29         print("2.Deposit")
30         print("3.Withdraw")
31         print("4.Exit")
32         print("#####")
33
34         choice = input("Enter your choice from 1-4:")
35
